

Beamsplitters are optical components used to split incident light at a designated ratio into two separate beams. Additionally, beamsplitters can be used in reverse to combine two different beams into a ...

The beamsplitter acts to divide the light's intensity in a given ratio over a range of wavelengths, generating two beams with the same spectral composition, if not the same intensity.

Optics & optical coatings Guide Beamsplitters selection Guide A beamsplitter is an optic that splits light into 2 directions. The split ratio of light transmittance and reflectance is 1:1 and is called a half mirror. ...

A diffractive beam splitter can generate either a 1-dimensional beam array (1xN) or a 2-dimensional beam matrix (MxN), depending on the diffractive pattern on the element.

Our plate beamsplitters have a coated front surface that determines the beam splitting ratio while the back surface is wedged and AR coated in order to minimize ghosting and interference effects.

These beamsplitters are made from high grade glass materials with laser grade surface flatness and surface quality and have a tighter tolerance on the splitting ratio.

By using a broadband polarizing splitter to divide the light from the laser, one can rotate the splitter to adjust the splitting ratio between the two fibers to any desired ratio.

Our polarizing splitters are available in both plate and cube forms in a wide variety of dimensions and shapes. If your design needs a specialized splitter, we can also fabricate custom ...

The performance is quantified by the splitting ratio, which describes the distribution of light intensity between the reflected and transmitted paths. A standard laboratory beamsplitter often ...

While most beam splitters have a fixed splitting ratio, variable beam splitters allow for the continuous adjustment of the ratio between reflected and transmitted power.
