

Experiments to be conducted on communication towers

In a groundbreaking demonstration and a "first of its kind," GITAI successfully demonstrated its robotics technology for constructing a 5-meter-high communication tower in an ...

Therefore, this article proposes a monopole communication tower deformation monitoring method based on multi-source data fusion using dynamic displacement as the evaluation indicator.

We must still know that Gustave Eiffel felt that if he did nothing, he would have to dismantle his tower, which is why he allowed a very large number scientific experiments, and one of them concerned ...

The Eiffel Tower was originally meant to be destroyed after 20 years, however, Gustave Eiffel who was the designer and engineer of this iconic landmark in Paris, knew that by utilising the tower for ...

The main aim of this paper is to present results of a full-scale pushover test of a 40 meter telecommunication tower under breaking load. A detailed description of the studied tower has been ...

In laboratory work and later large-scale experiments at Colorado Springs, Colorado, in 1899, Tesla developed his own ideas on how a worldwide wireless system would work.

Additionally, Gustave Eiffel encouraged numerous scientific experiments on the Tower: Foucault's Pendulum, the mercury pressure gauge, physiological studies and radio contact (1898). In the end, it ...

He envisioned this "World Wireless System" as being capable of using the Earth itself as a giant electrical circuit, providing power and communication signals, including telegraph and radio signals, ...

But, for the designs of telecommunication towers, seismic effects are not considered by the designers yet. Hence, a comprehensive study in this regard is very important to ensure the safety of these ...
