

AI brings intelligence and learning capabilities to relay systems, enabling them to: This means fewer false trips, faster fault clearance, and significantly improved power availability and...

Strengthening research on the relay protection system of intelligent substations and improving the reliability of the system are urgent problems that need to be solved.

The intelligent substation is equipped with many relay protection systems, each with unique hardware features that have a substantial influence on their operational lifespan, working ...

Based on the identified shortcomings of this existing technical solutions for the implementation of relay protection electrical networks, a method for implementing intelligent relay protection is proposed, ...

AI and ML technologies are revolutionizing relay protection in electrical power systems. With their ability to process large amounts of data and learn from it, these technologies improve fault ...

To achieve information sharing and interoperability among intelligent electrical equipment in intelligent substations, the author proposes research on relay protection and security technology ...

The approach proposed is to lump all conventional protection relays and functions into a Generic Relay. Furthermore, with the addition of a knowledge base, the complete protection system becomes an ...

This study proposes a fault diagnosis scheme of an intelligent substation relay protection system based on Transformer architecture and migration training model, aiming at improving the ...

According to the requirements of the "four characteristics" of relay protection (i.e., reliability, selectivity, sensitivity, and speed), once there is a fault within the power grid, it is ...

At the same time, the application of intelligent relay protection technology can greatly improve the safety and reliability of the power grid, providing strong support for the modernization ...
