

Terminal MCP is an MCP server that gives AI assistants a real-time view of your terminal session. It emulates a terminal environment so language models can see command output, type input, and ...

MCP (Model Context Protocol) is a framework for AI models that enables them to store data, run tools, and use prompts for specific tasks. We provide four examples to help you set up your MCP server in ...

In this repository, you'll find multiple examples of setting up MCP Servers. MCP (Model Context Protocol) is a framework for AI models that enables them to store data, run tools, and use prompts ...

As AI becomes more integrated in development, the terminal itself becomes an intelligent surface for reasoning, automation, and collaboration. Future versions of Warp may include deeper integrations ...

The Terminal Server is an MCP implementation that allows AI models, primarily Claude, to execute terminal commands in a controlled workspace environment. The system provides two ...

The Terminal Server is an MCP server that exposes a `run_command` tool to AI models, allowing them to execute arbitrary shell commands within a designated workspace directory ...

Run the tool to configure your environment and start interactively interfacing with AI: That's it. The quickest way to learn how to use the tool is to look at the Examples. Terminal AI requires an API key ...

Wrapping Up Congrats! You've successfully built an MCP server that can execute terminal commands. You can run it locally or in Docker, depending on your preference.

It functions as an MCP server, receiving commands from the AI, executing them in the terminal environment, and then returning the results back to the AI. This capability opens doors for ...

I'll setup login with the server to work, you don't have to worry about that. You need to create a file called `"/app/solution.txt"` with the word found in `"secret_file.txt"` in the `"secrets.7z"` archive. Your company ...
