

What s wrong with the optical port on the Huijue switch

You can quickly resolve SFP+ Module connectivity issues by following a systematic optical transceivers troubleshooting process. Check for common connection problems, such as link ...

If the wavelength and speed of the optical transceiver and the switch do not match, you can try to change the optical transceiver and then test, the switch port should be in the LINK state at ...

If the wavelength and speed of the optical transceiver and the switch do not match, you can try to change the optical transceiver and then test, the ...

Although it has a built-in automatic gain circuit, after the temperature exceeds a certain range, the transmitted optical power of the optical module is affected and decreased, thereby ...

Use the idle optical module on the storage device to exchange with PO and check whether the fault is rectified. If the fault persists, it indicates that the optical module is not faulty.

The first thing you should do is re-plug the optical module into the switch slot and make sure it is firmly inserted. If the problem persists, please check the compatibility of the optical module ...

First, you need to check whether the working modes of the two connected ports match with each other, or whether the working modes of the interface where the SFP+ module is located ...

Learn how to fix SFP issues fast: no link light, link flapping, detection errors, compatibility problems, and optical power checks.

Huawei Technical Support

Have you ever tried to plug an optic SFP+ transceiver into an SFP+ port to discover that the connection didn't work, i.e. traffic was very slow or there was no data transmission at all?

In this case, replace the current optical module with a supported optical module and then configure the stack port. For details about the optical modules supported by a port, see the description in " Stack ...
